

ሰራተኛ Serategna

Product & Technical Documentation

The work-to-credit operating system for Ethiopia's real economy

Phase 1 — The Marketplace · Master Specification v3.0

Prepared 17 June 2026 · Mo Creatives · Addis Ababa · Confidential

Document control

This document is the consolidated product and technical reference for the Serategna platform. It is intended for the founding team, engineers, investors, and institutional partners.

Field	Detail
Product	Serategna (■■■■■) — work-to-credit marketplace
Phase	1 — The Marketplace
Specification	Master Specification v3.0
Document version	1.0
Date	17 June 2026
Prepared by	Mo Creatives · Addis Ababa
Classification	Confidential
Implementation	TypeScript monorepo (web · server · mobile scaffold)

How to read this document

The document is organised into eight parts — Vision, Experience, Architecture, Algorithms, Trust & Compliance, Business, Delivery, and Roadmap — followed by appendices. Diagrams and tables summarise each area; the prose gives the rationale.

Contents

Part I — Vision & product

Executive summary · The problem: the delala economy · The Serategna solution · Who it serves — personas · Value proposition

Part II — Experience & design

Design system · Information architecture · User journeys · Matchmaking UX

Part III — Architecture & engineering

System architecture · Technology & languages · Monorepo layout · Data model · API surface · Engagement lifecycle

Part IV — Algorithms & intelligence

Matching algorithm · Serategna Score · Fair-wage model · Psychometric reliability

Part V — Trust, safety & compliance

Identity tiers · Guarantor & contracts · Security architecture · Privacy & data protection · Regulatory positioning

Part VI — Business & operations

Business model · Pricing & subscription · Enterprises · Unit economics & KPIs · Admin operations

Part VII — Delivery & deployment

Running locally · Docker & environment · Deployment topology

Part VIII — Roadmap & appendices

Known gaps · Roadmap · Job taxonomy · Demo accounts · Glossary

PART I

Vision & product

Why Serategna exists, the problem it removes, and the people it serves.

Executive summary

Serategna converts verified, paid informal work into a portable financial identity. It is a two-sided marketplace that connects households, businesses and institutions with vetted workers — from housemaids and tradespeople to formal contract staff — while removing the traditional broker (the *delala*). Every completed job builds a worker's Serategna Score and a shareable Verified Income Passport, accumulating the proprietary earnings dataset that later phases monetise through credit.

100%
worker keeps of pay

0
broker fee

≥80%
skill-match gate

300–850
Serategna Score

Pillars

- **Housemaid-first:** a front-and-centre flow to hire a trusted permanent maid with a mandatory legal guarantor (ጥክ), enforced fair wage and a flat monthly fee.
- **Direct pay, never held:** the platform never custodies money; employers pay workers directly.
- **Two-way relevance:** an 80% skill-match gate filters both job discovery and worker shortlisting.
- **Trust infrastructure:** tiered identity, certifications, psychometrics, guarantors, ratings, badges and an SoS desk.
- **Compliant by design:** no stored value means no NBE Payment Instrument Issuer licence is required.

The strategic asset

Phase 1 looks like a marketplace, but its real output is data: a verified, time-stamped record of who worked, for whom, for how much, and how reliably. That record is the collateral the formal financial system has never had for the informal economy — and the foundation Serategna's later credit products are built on.

The problem: the delala economy

Ethiopia's informal labour market — and domestic work in particular — runs on brokers (*delalas*). For the three parties involved, the current system fails in three different ways:

Stakeholder	Today's pain
Employer	Expensive broker commissions, no verified background, no recourse if a worker disappears.
Worker	Underpaid after the broker's cut, no record of experience, no path to credit or formal identity.
Maid (specifically)	Opaque placement, unsafe matches, wages far below a living wage, zero negotiating power.

Each broker introduction is a one-off: nothing compounds. The worker rebuilds trust from zero every time, and the employer gambles on a stranger. Serategna replaces that lossy handshake with a persistent, verifiable profile.

The cost of doing nothing

Without a trusted intermediary, the informal economy stays informal forever — invisible to lenders, unprotected by contracts, and trapped in a low-trust, low-wage equilibrium. The delala profits from that opacity; Serategna profits from removing it.

The Serategna solution

Serategna is the trusted intermediary rebuilt as software — cheaper, transparent, and cumulative.

Three coordinated layers

- **Marketplace:** post a job or get discovered; swipe to match; agree terms; track the engagement live; pay directly.
- **Trust layer:** identity, certifications, psychometrics, guarantors and ratings turn strangers into known, rated counterparties.
- **Identity layer:** the Serategna Score and Verified Income Passport make a worker's history portable and bankable.

Who it serves — personas

Hanna · Worker (housemaid)

Context. 28, looking for a stable, fairly-paid permanent placement near Bole.

Goals. Find safe work · be paid fairly & on time · build a record that proves her reliability.

Janani · Household client

Context. Working professional who needs a trustworthy maid without paying a delala.

Goals. Vetted, guarantor-backed candidates · clear pricing · accountability if something goes wrong.

Black Lion · Enterprise

Context. Institution that hires cleaners and support staff in bulk.

Goals. Pool talent · bulk-post · manage seats · optionally have Serategna run recruitment.

Operations / DPO · Admin

Context. Internal team running verification, disputes, safety and compliance.

Goals. Approve identities & certs · resolve disputes · monitor KPIs · honour lawful data requests.

Value proposition

For...	Serategna gives them...	Instead of...
Workers	100% of pay, a portable Score & income passport, fair-wage protection	broker cuts & an invisible work history
Employers	vetted, guarantor-backed, rated candidates with accountability	gambling on an unverified stranger
Maids	safe matches, a living wage floor, dignity & negotiating power	opaque, unsafe, underpaid placement
Enterprises	talent pools, bulk posting, managed recruitment	ad-hoc, unauditible hiring
Society	a bridge from the informal economy to formal credit	a permanent low-trust equilibrium

“Work. Build credit. Thrive.”

The promise is sequential: do verified work, and the platform turns that work into a financial identity that compounds.

Competitive differentiation

Serategna is not competing on listings — classifieds and Telegram groups already do that badly. It competes on **trust that compounds**. The table contrasts the alternatives an Ethiopian household or worker has today.

Channel	Trust	Fees	Record built?
Delala / broker	personal, one-off	high commission	none
Telegram / classifieds	none — caveat emptor	free	none
Agencies	variable	high, opaque	stays with agency
Serategna	verified, guarantor-backed	flat ETB 100/mo	portable Score + passport

The moat is the dataset

Anyone can clone a swipe UI. Almost no one can replicate a verified, multi-year record of who worked reliably for whom — and that record gets more valuable, and harder to catch up to, with every completed job.

PART II

Experience & design

The design system, app structure, and the journeys that make matchmaking feel effortless.

Design system

Serategna uses a Deep-Trust-Navy fintech palette with an electric-cyan accent for workers and indigo for employers, so the two sides of the marketplace feel distinct. Typography is a geometric heavy sans — Apple’s SF Pro Display natively, with Sora as the cross-platform fallback.

Navy

#0A192F

Slate

#1E293B

Cyan

#06B6D4

Cyan-Lt

#22D3EE

Indigo

#4F46E5

Emerald

#10B981

Amber

#F59E0B

Crimson

#E11D48

Type & tone

Token	Usage
Display / headings	SF Pro Display / Sora, weight 800, tight -0.03em tracking
Body	SF Pro Text / Sora, 400–600
Numerals	Bold, prominent — money & scores are the heroes
Languages	English · Amharic (፳፻፲፱) · Afaan Oromoo

Component language

- Rounded cards (1.6–2rem radii) with hairline borders and soft shadows.
- Tactile buttons with press-scale and ripple; gradient brand button.
- Swipe decks, status pills, reputation badges, toasts and skeleton loaders.
- Full light/dark theming via descendant CSS overrides — every surface adapts from one toggle.

60-30-10

Surfaces are ~60% neutral (white / soft grey), ~30% navy structure, and ~10% accent (cyan or indigo). Status colours — emerald, amber, crimson — are reserved strictly for success, pending and alert states.

Information architecture

One web bundle serves three audiences. A role switch flips between Worker and Client modes; admins use a separate operations console. Public, no-login surfaces (landing page, income passport, enterprises) sit outside the app shell.

Surface	Worker mode	Client mode
Primary tabs	Home · Jobs · Score · Wallet · Profile	Home · Browse · Post · Jobs · Profile
Core action	Swipe to quick-bid jobs	Swipe to shortlist workers · post a job
Tools	CV builder · certifications · assessment · guarantor	Company profile · contracts · enterprises

Public & admin surfaces

- **Landing page** (/) — marketing intro leading to the app and enterprises.
- **Verified Income Passport** (/p:id) — shareable, no login, with QR.
- **Enterprises** (/enterprises) — packages, contact, lead capture.
- **Admin console** (/admin) — verifications, certifications, disputes, SoS, leads, DPO data access, KPIs, integrations.

User journeys

Worker — from sign-up to paid

- Sign in with phone + OTP → onboard (trades, location, psychometric assessment).
- Swipe the job feed; jobs are pre-filtered to ≥80% relevance. Quick-bid in one tap.
- Get accepted → go BUSY → travel (live GPS) → start → complete.
- Employer marks paid → worker confirms → Score updates → worker is AVAILABLE again.

Client — hire a trusted housemaid

- Tap “Hire a trusted housemaid” → subscription gate (ETB 100/mo) → domestic-contract form.
- Guarantor is mandatory; a fair wage floor is enforced; agree terms in-app.
- Shortlist candidates by swiping; track the engagement; pay directly; sign the legal contract in person.

Engagement lifecycle

Worker set BUSY on Accept → set AVAILABLE again on Confirm. Live GPS + ETA throughout.

Matchmaking UX

Discovery is built as an Uber-meets-dating-app experience: a swipe deck with drag-reactive LIKE/NOPE stamps, spring physics, a peeking card stack, a rewind action, and a glowing gradient like button. The same deck powers both the worker job feed and the client worker search.

How a match score is built

- Every card shows a transparent match percentage and the reasons behind it.
- Live taxi-style tracking and ETA appear once an engagement is active.
- List and map alternatives exist for users who prefer them.

Localisation & accessibility

The target users span literacy levels and three major languages. The taxonomy is fully trilingual today; the roadmap closes the remaining gaps for low-literacy users.

Dimension	Status
Languages	English · Amharic (ፊደል) · Afaan Oromoo (Qubee) across the job taxonomy
Calendar	Dual Gregorian + Ethiopian date display
Currency	ETB throughout, bold and prominent
Icons-first UI	heavy use of recognisable icons to reduce reading load
Planned	full UI string translation · voice/IVR/USSD onboarding · audio prompts

Accessibility is not done

A formal pass for screen-reader labels, focus order, colour contrast, and a low-literacy voice path is still outstanding — and it matters more here than in a typical fintech, because the flagship user is a housemaid who may not read fluently.

PART III

Architecture & engineering

How the system is built — stack, structure, data, APIs, and state.

System architecture

Serategna is a TypeScript monorepo. A single React web bundle serves workers, clients and admins; an Express API enforces all business rules; Prisma manages the database; and external services sit behind swappable adapters.

Design decisions

- **Server-side enforcement** of wage floors, the 80% gate, posting/application quotas, and phone masking.
- **Append-only double-entry ledger** retained for reconciliation integrity (now notional, since funds are not held).
- **Adapter seams** for payments, SMS, push, Telegram and Fayda/MOSIP, each with a mock fallback and admin status panel.
- **SQLite in dev, Postgres in prod** — zero database to install locally; a script flips Prisma for Docker.

Technology & languages

The whole system is TypeScript/Node. There is no Python.

Source files by type

Tier	Stack
Web app (live product)	React 18 · Vite · React Router · Tailwind CSS · TypeScript
Backend API	Node.js · Express · Prisma · Zod · JWT · Helmet · tsx
Database	SQLite (dev) · PostgreSQL (prod)
Mobile	Expo / React Native — scaffold only
Infrastructure	Docker · docker-compose

Mobile is a scaffold

The mobile/ folder contains an Expo + React Native starter, but its screens are the default template — none of the Serategna features are implemented there. The fully-built product is the mobile-first web app.

Monorepo layout

```
serategna-v3/  
  server/    Express API + Prisma (23 route groups, business logic, ledger)  
    src/routes  auth jobs bids catalog score ratings wallet disputes ...  
    src/lib      matching score wage subscription badges enterprise audit  
    prisma/      schema.prisma (29 models) + seed  
  web/        React + Vite app (24 pages, components, libs)  
    src/{pages,components,lib}  
  mobile/     Expo / React Native scaffold  
  docs/       architecture security business algorithm + SQL schema + PDFs  
  docker-compose.yml
```

29
data models

23
API route groups

24
web pages

3
apps in monorepo

Data model

The Prisma schema defines 29 models across eight domains.

Domain	Models
Identity & access	User, RefreshToken, OtpCode, VerificationRequest, AuditLog, Consent
Profiles	WorkerProfile, BusinessProfile, Agent
Work & matching	Job, Bid, Message, SavedItem, PriceBand
Money (notional)	LedgerEntry, Payout
Trust & reputation	Rating, Certification, PsychometricResult, ScoreSnapshot
Agreements	Contract, ContractSignature, Guarantor
Safety & ops	Dispute, SosEvent
Growth & comms	Subscription, Lead, Notification, NotificationLog

The Job entity

Job is the spine of the system. It carries the engagement lifecycle, scheduling, an auto-expiring application deadline, live-GPS fields for tracking, pricing (bid or fixed with a wage floor), employment metadata (gig ... permanent, formal/informal, positions), and domestic-contract details (live-in, duties, day-off, guarantor-required).

API surface

The API exposes 23 route groups under /api, all rule-enforcing and Zod-validated.

auth · profiles · jobs · bids · catalog · score · ratings · wallet · disputes · sos · identity · contracts · guarantors · credentials · legal · notifications · saved · subscription · enterprise · public · ai · integrations · admin

Group	Responsibility
jobs	post, bid, accept, track, mark-paid, finalize, feed, expiry sweep
subscription	employer plans, post/application quotas, 80% gate constant
public	no-login Verified Income Passport
enterprise	packages, contact, lead capture
admin	verifications, certifications, disputes, SoS, leads, DPO access, KPIs

Engagement lifecycle

A job moves through a deterministic state machine. The worker's availability is coupled to it, so a hired worker is hidden from new matches until the engagement is finalised.

Engagement lifecycle

Worker set BUSY on Accept → set AVAILABLE again on Confirm. Live GPS + ETA throughout.

State	Meaning	Side effect
open	accepting bids	counts against deadline; auto-expires
accepted	worker chosen	worker → BUSY
enroute / started	travelling / on-site	live GPS + ETA
completed	work done	awaiting payment
paid	employer marked paid	worker confirms next
confirmed	both agree	Score updates · worker → AVAILABLE

Catalogue, taxonomy & search

A structured catalogue underpins matching, search, filters and the CV builder. It is the single source of truth for what work exists and how it is priced by area.

- **20 groups, 270+ roles**, each trilingual and tagged by work type [F][I][G][S].
- **Price bands** per (category, sub-city) drive the fair-price guidance shown on posting and bidding.
- **Sub-cities** with coordinates power distance/proximity scoring and the map pickers.
- **Roles drive matching**: a role-level match scores higher (75) than a category-level match (68).

Catalogue object	Feeds
Category / group	feed filters, posting, CV skills
Role / specialisation	match precision, search
PriceBand	fair-price band, wage-floor context
Sub-city	proximity scoring, maps

PART IV

Algorithms & intelligence

The deterministic, explainable logic behind matching, scoring and fair pay.

Matching algorithm

Matching is deterministic and skill-first, so it is fully explainable. A skill-fit base is combined with a weighted quality term, scaled, and gated at 80% in both directions.

How a match score is built

```
fit      = roleMatch ? 75 : categoryMatch ? 68 : 12
quality  = (proximity*0.35 + score*0.30 + rating*0.20
           + verified*0.10 + freshness*0.05) * 25
total    = clamp(fit + quality)           # x0.6 if worker is busy
show     = total >= 80                   # the hard gate, both ways
```

Why a gate, not a ranking only

A pure ranking still shows weak matches at the bottom. The 80% gate keeps the feed relevant and the application quota meaningful — workers spend their 5 monthly applications only on jobs they genuinely fit.

Serategna Score

The Serategna Score (300–850) is the worker's financial-trust signal, composed of four weighted components.

Component	Drivers
Transaction integrity (35%)	completed jobs, confirmations, absence of no-shows/disputes
Earnings consistency (30%)	regularity of verified income over time
Platform behaviour (20%)	conduct + psychometric reliability index
Relationship capital (15%)	ratings, repeat hires, verified-certification boost

Explainable by design

Every score is reconstructable from its inputs and every match shows its reasons. No opaque black box decides who works or who gets credit — essential for fairness and for regulatory defensibility.

Fair-wage model

To end underpayment, a living-wage floor is enforced server-side on every job — on both posting and bidding. Floors are prorated by rate type; live-in roles use a cash floor on top of room & board.

ETB 8,000
living wage / month

ETB 5,000
live-in cash floor

ETB 150
minimum task price

Rate type	Floor basis
Monthly	full living wage (or live-in cash floor for live-in roles)
Weekly / daily / hourly	prorated from the monthly living wage
Fixed task	minimum task price

The posting UI shows the floor live and blocks any price beneath it, with a clear explanation that fair pay protects workers from exploitation. There is no broker commission — the worker keeps 100%.

Psychometric reliability

At onboarding, workers take a short trilingual assessment (conscientiousness, integrity, punctuality). It produces a reliability index (0–100) and trait profile that feeds both the Score (platform-behaviour component) and the matching quality term — giving new workers with no job history a fair, evidence-based starting signal.

Cold-start, solved fairly

Without history, a new worker would rank last forever. The psychometric index and verified certifications give them a legitimate way to earn early trust — meritocratic, not seniority-based.

PART V

Trust, safety & compliance

Identity, guarantors, security, privacy, and the regulatory stance.

Identity tiers

Identity is tiered against Fayda (the national digital ID). Capabilities unlock as trust rises.

Tier	Unlocks
Tier 0 · Provisional	browse and work with caps
Tier 1 · Fayda-verified	verified badge, withdrawals, full participation
Tier 2 · Credit-ready	eligibility for credit & financial products

Guarantor & contracts

Serategna encodes the Ethiopian legal surety — የከራ ዋስ (ye-sera wastina) — as a first-class object. For permanent housemaid hires a guarantor is mandatory.

- **Guarantor (■ ■ ■):** a named surety who accepts responsibility; amount-capped; backs trust and credit.
- **Consensus, not contract:** the in-app agreement records mutual consensus only.
- **Binding contract in person:** the legally binding contract is printed and signed face-to-face (Proclamation 1205/2020).
- **Suretyship:** follows Proclamation 1243/2021.

Why agreement, not e-contract

Keeping the binding signature off-platform avoids over-reaching on enforceability and keeps Serategna clearly a facilitator — not a party to the employment contract.

Security architecture

- **Authentication:** phone + OTP with brute-force lockout (5 attempts), per-phone cooldown, per-IP rate limiting; JWT access + rotating refresh tokens.
- **Transport & headers:** Helmet with a strict Content-Security-Policy, HSTS preload, x-powered-by disabled.
- **Auditability:** tamper-evident AuditLog (with IP) on sensitive admin actions.
- **Confidentiality:** phone numbers masked unless owned, admin, or an engaged counterparty on an active job.
- **Financial risk:** no funds custody removes the largest class of financial risk outright.

5

OTP attempts then lock

0

funds custodied

strict

CSP + HSTS

IP-logged

admin actions

Privacy & data protection

Data handling is aligned with Ethiopia's Personal Data Protection Proclamation No. 1321/2024.

- A consent ledger records what each user agreed to and when.
- A DPO data-subject access tool returns everything held on a person — restricted to admins, fully audited, and legally framed.
- Data minimisation: phone masking, scoped queries, and no third-party data sale.

Lawful access, by construction

The admin data tool only returns a single named data-subject's own record, logs every lookup to the audit trail, and states its legal basis on screen — access within the legal framework, not around it.

Regulatory positioning

Serategna is deliberately structured so it does not require an NBE Payment Instrument Issuer licence.

Principle	How it is honoured
No stored value	no wallet balance a user can top up or hold
No held funds	payment flows directly employer → worker, off-platform
Revenue is subscription	platform funded by a flat fee, not a cut of wages
Ledger is notional	double-entry kept for reconciliation, not custody

Stay inside the line

The moment the platform holds or routes user funds, the PI-licence trigger applies. Any future payment feature must preserve the no-custody principle or be delivered through a licensed partner.

Integrity & anti-abuse

A trust marketplace is only as strong as its defence against gaming. Current controls and planned hardening:

Vector	Today	Planned
Fake accounts	OTP + Fayda tier gates	device fingerprinting, velocity limits
Fake reviews	ratings gated to real jobs	text moderation, anomaly detection
Wage abuse	server-side wage floor	outlier flagging on bids
Disintermediation	repeat-pair leakage KPI	incentives to stay on-platform
Identity fraud	manual review fallback	automated Fayda/MOSIP verification

Where the risk concentrates

Because pay is off-platform, the highest-residual-risk events are no-shows and post-match leakage. The roadmap's payment-proof capture and stronger repeat-pair incentives target exactly these.

PART VI

Business & operations

How Serategna makes money, prices its services, and runs day to day.

Business model

Phase 1 revenue is a flat employer subscription — never a commission on wages. This keeps worker take-home at 100% and aligns incentives around volume and trust rather than wage extraction.

Illustrative Phase-1 revenue mix

Later phases monetise the verified-earnings dataset through credit and financial-identity products — the reason the Score and income passport are built from day one.

Pricing & subscription

Plan	Price	Allowance
Employer · monthly	ETB 100 / month	5 job posts / month
Employer · annual	ETB 1,000 / year	5 posts / month (≈17% saving)
Permanent housemaid	included	capped 4 posts / year · guarantor required
Worker	free	5 job applications / month

Why caps, not unlimited

Caps keep the marketplace high-signal: employers post real vacancies, workers apply only where they fit, and the housemaid cap reflects how rarely a household actually re-hires.

Enterprises

Institutions get a dedicated track — talent pooling, bulk posting, manager seats, or a fully managed service.

Package	Price	What's included
Team	ETB 1,500 / mo	25 posts/mo · 2 seats · shared shortlist · priority support
Institution	ETB 6,000 / mo	100 posts/mo · 5 seats · private talent pool · account manager
Serategna-Managed	custom	we recruit, vet & roster · SLA-backed · monthly reporting

Contact & call centre

Channel	Detail
Call centre	+251 960 00 00 00 · short code 8294
Email	support@serategna.et · enterprise@serategna.et
Address	Bole Sub-city, Addis Ababa, Ethiopia
Hours	Mon–Sat, 8:00–20:00 (EAT)

Unit economics & KPIs

The admin console tracks live KPIs and a balancing ledger. Illustrative Phase-1 targets:

Illustrative Phase-1 health metrics (%)

KPI	Why it matters
Active workers / Tier-1 share	supply depth & trust quality
Jobs completed	marketplace liquidity
Subscription revenue	the only Phase-1 revenue line
Dispute rate	trust & safety health
Repeat-pair on-platform share	disintermediation (anti-leakage), target ≥60%

Admin operations

A single operations console runs the trust and safety machinery:

- Verification queue (Tier 0 → Tier 1) and certification verification against issuing institutions.
- Dispute resolution and an SoS desk (encrypted audio held by the emergency provider, not Serategna).
- Leads inbox (enterprise / callback / support) and a DPO data-subject access tool.
- Reconciliation, business KPIs, and integration status monitoring.

Go-to-market

Launch concentrates on a single high-pain wedge — permanent housemaids in Addis Ababa — then expands category by category once liquidity and trust are proven.

- **Wedge:** housemaid placement in a few Addis sub-cities, where the delala pain is sharpest.
- **Supply first:** recruit and verify workers (with guarantors) before pushing demand, so early employers see quality.
- **Trust proof:** the guarantor + fair-wage + ratings stack is the marketing message, not just a feature.
- **Expand:** adjacent domestic & trades categories, then enterprise accounts for volume.

PART VII

Delivery & deployment

Running the app locally, in Docker, and in production.

Running locally

The API uses SQLite by default — no database to install. Requires Node.js 20+.

```
# from serategna-v3/  
npm run first-run      # install, set up the DB, start API + Web  
# Windows: double-click START.bat  
# open http://localhost:5173
```

Phone testing over LAN

The dev server is exposed on the network (host: true). Scan the generated QR with your phone camera while on the same Wi-Fi to open the app in mobile Safari/Chrome.

Docker & environment

```
cp .env.example .env          # strong JWT secrets + DB password
docker compose up --build      # Postgres + API + web
# web on http://localhost:8080 , API proxied at /api
# production: SEED_ON_START=false OTP_DEV_MODE=false
```

Variable	Purpose
DATABASE_URL	Postgres connection (prod)
JWT_SECRET / JWT_REFRESH_SECRET	token signing
OTP_DEV_MODE	return OTP in dev only — false in prod
SEED_ON_START	seed demo data — false in prod
PAYMENT_ADAPTER / *_API_KEY	integration adapters (mock by default)

Deployment topology

The web container serves static assets and proxies /api to the API container; the API targets PostgreSQL, applies the schema on boot, runs as a non-root user, and talks to external services only through adapters.

PART VIII

Roadmap & appendices

Where the product is honest about its gaps — and where it goes next.

Known gaps — an honest assessment

The end-to-end flows work and the ledger reconciles, but several areas are not yet production-grade. By priority:

Critical

- **No automated tests** across server or web.
- **“AI” is rule-based** — CV builder, job-draft and license import are deterministic parsers, not an LLM.
- **Integrations are mocks** — payments, SMS, push, Telegram, Fayda all fall back to stubs; OTP is logged, not sent.
- **No payment proof** — off-platform pay has no receipt/reference capture to back disputes.
- **Feed does not scale** — all open jobs loaded into memory and filtered in JS; no geo-index or pagination.

High value

- Real-time is polling, not WebSocket/SSE.
- Low-literacy onboarding (voice/IVR/USSD, audio prompts) and full UI translation still needed.
- No offline/PWA shell; disputes capture text only; no observability (Sentry/metrics/health).

Medium

- prisma db push (no migration history); no backup/restore plan.
- Account recovery, admin 2FA & granular roles, anti-abuse (fake accounts/reviews).
- Cancellation/no-show policy, background checks, guarantor identity verification, VAT/TOT receipts, a11y & CI/CD.

Roadmap

Phase	Focus	Outcome
Phase 1 (now)	The marketplace	verified work + the earnings dataset
Phase 2	Verified-credit	lending against the Serategna Score
Phase 3	Financial identity	portable identity accepted by third parties
Phase 4	Ecosystem	insurance, savings, B2B data & APIs

Appendix A — Job taxonomy (sample)

20 groups and 270+ roles, trilingual, tagged by work type [F]ormal [I]nformal [G]roup [S]hort-run.

Group	Sample roles
Home & cleaning	house cleaner, live-in maid, deep-clean crew, laundry
Care	childcare, elderly care, patient companion
Construction & trades	mason, painter, electrician, plumber, carpenter
Hospitality	waiter, cook, dishwasher, barista, event staff
Logistics	porter, mover, delivery, warehouse hand
Professional / formal	accountant, security guard, receptionist, driver

Appendix B — Demo accounts

In development the OTP is auto-filled. Sign in with any of:

Role	Phone
Client (Janani)	+251922000001
Worker · Tier 1 (Hanna)	+251911000001
Worker · Tier 0 (Meron)	+251911000007
Admin / Operations	+251900000000

Appendix C — Glossary

Term	Meaning
Serategna (ሰራተኛ)	“worker” in Amharic; the product name
Delala	traditional broker/middleman the platform replaces
Wastina (ወስኑ)	legal guarantor / surety
Fayda	Ethiopia's national digital identity
Serategna Score	300–850 financial-trust score
Income Passport	shareable, no-login proof of verified work & income
80% gate	minimum skill-match to see/apply, both directions

Serategna · ሰራተኛ — Work · Build credit · Thrive. Prepared for Mo Creatives, Addis Ababa. Confidential.
